MD AHMAD

DATA ANALYST | SQL — POWER BI — EXCEL — PYTHON

Patna, Bihar, India | +91 75468 63947 | ahmadfed966@gmail.com
Github | LinkedIn | Portfolio

Summary

BCA graduate (2026) skilled in SQL, Power BI, Excel, and Python (pandas, scikit-learn). Experienced in data cleaning, EDA, KPI dashboards, segmentation, churn and funnel analysis, A/B testing, and anomaly detection — turning datasets into clear business recommendations.

Technical Skills

SQL: SELECT, WHERE, JOINs, GROUP BY, HAVING, Subqueries, CTEs, Aggregate Functions, Window Functions

Excel: Pivot Tables, XLOOKUP, VLOOKUP, INDEX-MATCH, IF, SUMIF, COUNTIF, Charts, Conditional Formatting, Power Query

Power BI: Power Query, Data Modeling, DAX Measures, Calculated Columns, KPIs, Slicers, Drill-through, Interactive Dashboards

Python: Pandas, NumPy, Matplotlib, scikit-learn, Exploratory Data Analysis

Data Analytics: Data Cleaning, Data Validation, EDA, Segmentation, KPI Analysis, MoM/QoQ/YoY Analysis, Cohort Analysis, Churn & Retention Analysis, Funnel Analysis, A/B Testing, Anomaly Detection, Reporting

Projects

UPI Fraud Detection – Fintech Analytics (Python · scikit-learn · Pandas)

- Benchmarked three detectors — IQR, Isolation Forest, and time-series anomaly detection — on 10,000 labeled synthetic UPI transactions, comparing precision and recall to match the right method to each fraud pattern.
- Found fraud concentrates in the dead of night: a 72% fraud rate at 4am — the key signal for when to tighten transaction monitoring.
- End-to-end Python pipeline (pandas, scikit-learn); full write-up and charts on GitHub.

AI Anomaly Agent – Diagnostic Analytics (Python · SQL · Excel)

- Built an agent that reads any business Excel file, flags metric spikes and drops with z-score and IQR, and explains each anomaly in plain English with business context — plus staged email alerts.
- Caught all 5 injected anomalies (flash sale, viral traffic, demand slump, ad overspend, checkout bug) across 90 days of data with zero misses; a SQL layer reproduces the detection.
- Built for non-technical stakeholders: explanations, not just flags.

A/B Test: Checkout Funnel – Experimentation (Python · SQL · SciPy)

- Ran end-to-end A/B analysis on 20,000 users: the redesigned checkout lifted purchases by +2.52pp (11.98% → 14.50%, $z = 5.25$, $p < 0.001$, 95% CI [+1.58pp, +3.45pp]) — verdict: ship.
- Segmented the win: desktop gained +7.00pp (significant) while mobile stayed flat — recommended a desktop-only rollout; funnel analysis isolated the gain to the checkout→payment step (+8.06pp).
- Verified experiment health first (sample-ratio-mismatch check passed, $p = 0.38$); a MySQL query pack reproduces every KPI — SQL for extraction and aggregation, Python for significance testing.

Education

Maulana Mazharul Haque Arabic and Persian University, Patna
Bachelor of Computer Applications (BCA) — 2026
