Summary

BCA graduate (2026) skilled in Excel, SQL, Power BI, and Python (pandas, scikit-learn). Experienced in data cleaning, EDA, KPI dashboards, segmentation, churn and funnel analysis, A/B testing, and anomaly detection — turning datasets into clear business recommendations.

Technical Skills

Excel: Pivot Tables, XLOOKUP, VLOOKUP, INDEX-MATCH, IF, SUMIF, COUNTIF, Charts, Conditional Formatting, Power Query

SQL: SELECT, WHERE, JOINS, GROUP BY, HAVING, Subqueries, CTEs, Aggregate Functions, Window Functions

Power BI: Power Query, Data Modeling, DAX Measures, Calculated Columns, KPIs, Slicers, Drill-through, Interactive Dashboards

Python: Pandas, NumPy, Matplotlib, scikit-learn, Exploratory Data Analysis

Data Analytics: Data Cleaning, Data Validation, EDA, Segmentation, KPI Analysis, MoM/QoQ/YoY Analysis, Cohort Analysis, Churn & Retention Analysis, Funnel Analysis, A/B Testing, Anomaly Detection, Reporting

Projects

AI Anomaly Agent – Diagnostic Analytics (Python · SQL · Excel)

- Built an agent that reads business Excel files, detects metric spikes and drops with z-score and IQR, explains each anomaly in plain English with business context, and stages formatted email alerts (demo mode).
- Validated on 90 days of data with five injected anomalies (flash sale, viral traffic, demand slump, ad overspend, checkout bug) – detected all five with zero misses.
- Runs on any Excel file with a date column and numeric metrics; built for non-technical stakeholders who need explanations, not just flags.

Customer Churn & Retention – Business Analytics (Python · SQL · Statistics)

- Analyzed 5,000 SaaS customers: 22.9% churn overall (95% CI 21.7–24.0%), worst in the Startup segment (29.3%) and Basic plan (31.5%); segment differences statistically significant (χ^2 test, $p < 0.001$).
- Built cohort retention curves; churned customers averaged 2.2 support tickets and 29.5 dormant days versus 1.5 tickets and 4.0 days for retained customers.
- Computed LTV:CAC by segment (Startup 3.0x, SMB 1.7x, Mid-market 1.0x) to prioritize retention spend, and delivered a targeted save-playbook for at-risk accounts.

A/B Test: Checkout Redesign – Experimentation (Python · SQL · SciPy)

- Ran end-to-end A/B analysis on 20,000 users: the redesigned checkout lifted purchases by 2.52pp (11.98% to 14.50%, $p < 0.001$, 95% CI [+1.58pp, +3.45pp]) – verdict: ship.
- Segmented the win: desktop gained 7.0pp while mobile stayed flat (not significant), so recommended a desktop-only rollout; funnel analysis pinpointed the gain at the checkout-to-payment step (+8.06pp).
- Compared first-touch vs last-touch attribution across channels to guide budget allocation; verified experiment health with sample-ratio mismatch checks (passed, $p = 0.38$).

Education

Maulana Mazharul Haque Arabic and Persian University, Patna

2026

Bachelor of Computer Applications (BCA)
